

## TITLE OF THE INVENTION

PHENYLCARBOXAMIDE BETA-SECRETASE INHIBITORS FOR THE TREATMENT OF  
ALZHEIMER'S DISEASE

## 5 FIELD OF THE INVENTION

The present invention relates to phenylcarboxamide compounds that are useful for the prevention and treatment of Alzheimer's disease. More particularly, the present phenylcarboxamide compounds are useful inhibitors of  $\beta$ -secretase, the  $\beta$ -site amyloid precursor protein-cleaving enzyme ("BACE").

10

## BACKGROUND OF THE INVENTION

Alzheimer's disease is characterized by the abnormal deposition of amyloid in the brain in the form of extra-cellular plaques and intra-cellular neurofibrillary tangles. The rate of amyloid accumulation is a combination of the rates of formation, aggregation and egress from the 15 brain. It is generally accepted that the main constituent of amyloid plaques is the 4kD amyloid protein ( $\beta$ A4, also referred to as A $\beta$ ,  $\beta$ -protein and  $\beta$ AP) which is a proteolytic product of a precursor protein of much larger size. The amyloid precursor protein (APP or A $\beta$ PP) has a receptor-like structure with a large ectodomain, a membrane spanning region and a short cytoplasmic tail. The A $\beta$  domain encompasses parts of both extra-cellular and transmembrane 20 domains of APP, thus its release implies the existence of two distinct proteolytic events to generate its NH<sub>2</sub>- and COOH-termini. At least two secretory mechanisms exist which release APP from the membrane and generate soluble, COOH-truncated forms of APP (APP<sub>s</sub>). Proteases that release APP and its fragments from the membrane are termed "secretases." Most 25 APP<sub>s</sub> is released by a putative  $\alpha$ -secretase which cleaves within the A $\beta$  protein to release  $\alpha$ -APP<sub>s</sub> and precludes the release of intact A $\beta$ . A minor portion of APP<sub>s</sub> is released by a  $\beta$ -secretase (" $\beta$ -secretase"), which cleaves near the NH<sub>2</sub>-terminus of APP and produces COOH-terminal fragments (CTFs) which contain the whole A $\beta$  domain.

Thus, the activity of  $\beta$ -secretase or  $\beta$ -site amyloid precursor protein-cleaving enzyme ("BACE") leads to the abnormal cleavage of APP, production A $\beta$ , and accumulation of  $\beta$  30 amyloid plaques in the brain, which is characteristic of Alzheimer's disease (see R. N. Rosenberg, Arch. Neurol., vol. 59, Sep 2002, pp. 1367-1368; H. Fukumoto et al, Arch. Neurol., vol. 59, Sep 2002, pp. 1381-1389; J.T. Huse et al, J. Biol. Chem., vol 277, No. 18, issue of May 3, 2002, pp. 16278-16284; K.C. Chen and W.J. Howe, Biochem. Biophys. Res. Comm, vol. 292,

pp 702-708, 2002). Therefore, therapeutic agents that can inhibit  $\beta$ -secretase or BACE may be useful for the treatment of Alzheimer's disease.

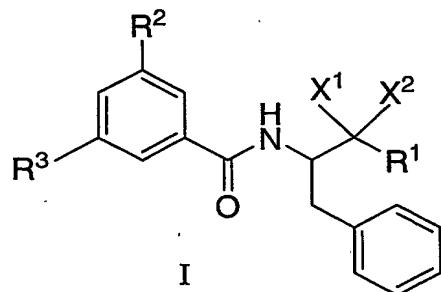

The compounds of the present invention are useful for treating Alzheimer's disease by inhibiting the activity of the  $\beta$ -secretase or BACE, thus preventing the formation of insoluble A $\beta$  and arresting the production of A $\beta$ .

## SUMMARY OF THE INVENTION

The present invention is directed to compounds that are inhibitors of the  $\beta$ -secretase enzyme that are useful in the treatment or prevention of diseases in which the  $\beta$ -secretase enzyme is involved, such as Alzheimer's disease. The invention is also directed to pharmaceutical compositions comprising these compounds and the use of these compounds and compositions in the prevention or treatment of such diseases in which the  $\beta$ -secretase enzyme is involved.

Several documents disclose compounds that may be relevant to the phenylcarboxamide compounds of the present invention, for example WO99/61423 (Derwent 2000-097099), WO99/54305 (Derwent 2000-052697), WO99/54320 (Derwent 2000-023164), WO99/54310 5 (Derwent 2000-023162), DE19818614 (Derwent 2000-000334), DE19817461 (Derwent 1999-591908), WO98/25883 (Derwent 98-348419), DE19650975 (Derwent 98-323649), WO95/12611 (Derwent 95-185737), WO96/22275, WO02/002505, US 2002/0128255 and US 2002/0016320.

The compounds of the instant invention have at least one asymmetric center. Additional asymmetric centers may be present depending upon the nature of the various substituents on the 10 molecule. Compounds with asymmetric centers give rise to enantiomers (optical isomers), diastereomers (configurational isomers) or both, and it is intended that all of the possible enantiomers and diastereomers in mixtures and as pure or partially purified compounds are included within the scope of this invention. The present invention is meant to encompass all such isomeric forms of these compounds.

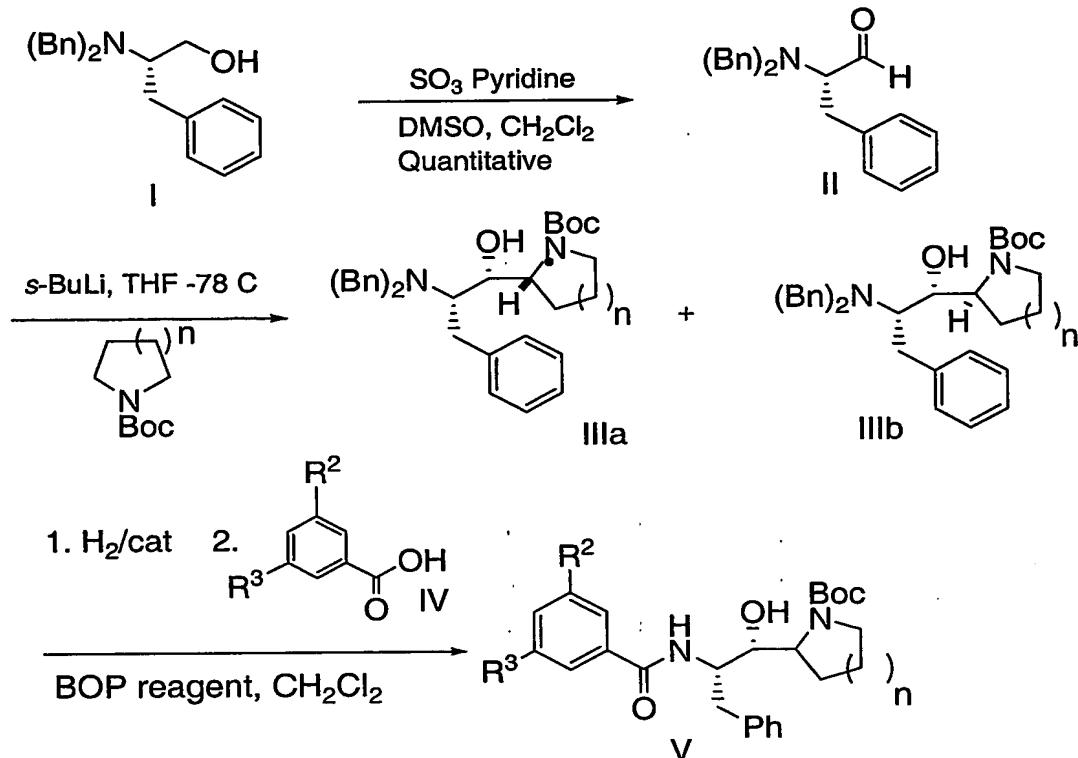

15 The independent syntheses of the enantiomerically or diastereomerically enriched compounds, or their chromatographic separations, may be achieved as known in the art by appropriate modification of the methodology disclosed herein. Their absolute stereochemistry may be determined by the x-ray crystallography of crystalline products or crystalline intermediates that are derivatized, if necessary, with a reagent containing an asymmetric center of 20 known absolute configuration.

If desired, racemic mixtures of the compounds may be separated so that the individual 25 enantiomers are isolated. The separation can be carried out by methods well known in the art, such as the coupling of a racemic mixture of compounds to an enantiomerically pure compound to form a diastereomeric mixture, followed by separation of the individual diastereomers by standard methods, such as fractional crystallization or chromatography. The coupling reaction is often the formation of salts using an enantiomerically pure acid or base. The diasteromeric derivatives may then be converted to the pure enantiomers by cleavage of the added chiral residue. The racemic mixture of the compounds can also be separated directly by 30 chromatographic methods utilizing chiral stationary phases, which methods are well known in the art.

Alternatively, any enantiomer of a compound may be obtained by stereoselective synthesis using optically pure starting materials or reagents of known configuration by methods well known in the art.

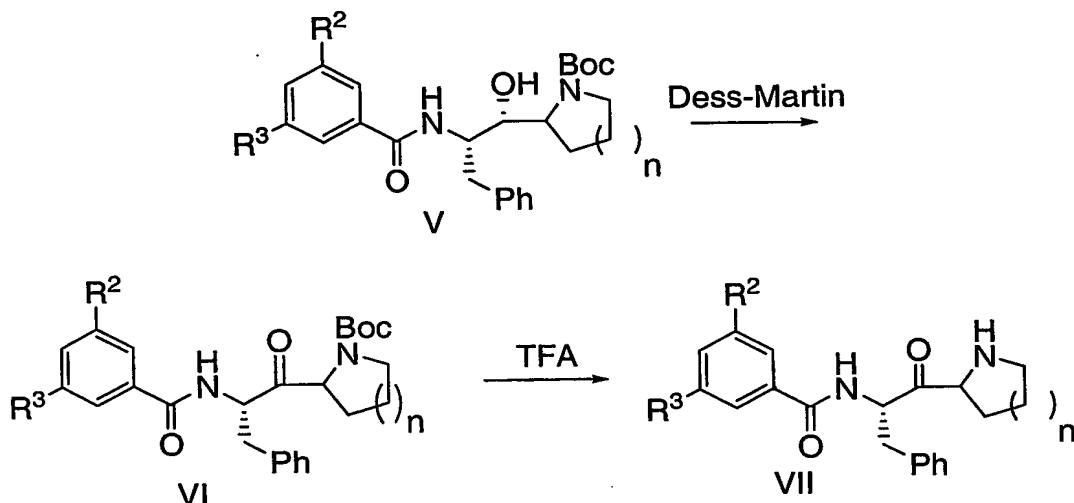

The compounds of the present invention are prepared by the methods outlined in Schemes 1A-1C and 2.

of excretion, drug combination, the severity of the particular condition, and the host undergoing therapy.

## BIOLOGICAL ACTIVITY

5       The utility of the compounds in accordance with the present invention as inhibitors of  $\beta$ -secretase enzyme activity may be demonstrated by methodology known in the art. Enzyme inhibition is determined as follows.

### FRET Assay

10      A homogeneous end point fluorescence resonance energy transfer (FRET) assay is employed with the substrate ([TAMRA-5-CO-EEISEVNLDQEF-NHQSY] QFRET), which is cleaved by BACE 1 to release the fluorescence from TAMRA. The Km of the substrate is not determined due to the limit of solubility of the substrate. A typical reaction contains approximately 30 nM enzyme, 1.25  $\mu$ M of the substrate, and buffer (50 mM NaOAc, pH 4.5, 0.1 mg/ml BSA, 0.2% CHAPS, 15 mM EDTA and 1 mM deferoxamine) in a total reaction volume of 100  $\mu$ l. The reaction is proceeded for 30 min and the liberation of TAMRA fragment is measured in a 96-well plate LJL Analyst AD using an excitation wavelength of 530 nm and an emission wavelength of 580 nm. Under these conditions, less than 10% of substrate is processed by BACE 1. The enzyme used in these studies was soluble (transmembrane domain and cytoplasmic extension excluded) human protein produced in a baculovirus expression system. To measure the inhibitory potency of compounds, solutions of inhibitor in DMSO (four concentrations of the inhibitors were prepared: 1mM, 100  $\mu$ M, 10  $\mu$ M, 1  $\mu$ M) were included in the reactions mixture (final DMSO concentration is 0.8%). All experiments were conducted at room temperature using the standard reaction conditions described above. To determine the IC<sub>50</sub> of the compound, competitive equation  $V_0/V_i = 1 + [I]/[IC_{50}]$  were employed to predict the inhibitory potency of the compounds. The errors in reproducing the dissociation constants are typically less than two-fold.

### HPLC assay

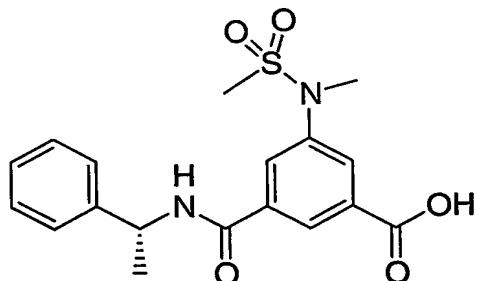

30      A homogeneous end point HPLC assay is employed with the substrate (coumarin-CO-REVNFEVEFR), which is cleaved by BACE 1 to release the N-terminal fragment attached with coumarin . The Km of the substrate is greater than 100  $\mu$ M and can not be determined due to the limit of solubility of the substrate. A typical reaction contains approximately 2 nM enzyme, 1.0  $\mu$ M of the substrate, and buffer (50 mM NaOAc, pH 4.5, 0.1 mg/ml BSA, 0.2% CHAPS, 15 mM

EDTA and 1 mM deferoxamine) in a total reaction volume of 100 µl. The reaction is proceeded for 30 min and the reaction is stopped by the addition of 25 µL of 1 M Tris-HCl, pH 8.0. The resulting reaction mixture was loaded on the HPLC and the product was separated from substrate with 5 min linear gradient. Under these conditions, less than 10% of substrate is processed by  
 5 BACE 1. The enzyme used in these studies was soluble (transmembrane domain and cytoplasmic extension excluded) human protein produced in a baculovirus expression system. To measure the inhibitory potency for compounds, solutions of inhibitor in DMSO (12 concentrations of the inhibitors were prepared and the concentration rage was dependent on the potency predicted by FRET) were included in the reaction mixture (final DMSO concentration is  
 10 10 %). All experiments were conducted at room temperature using the standard reaction conditions described above. To determine the IC<sub>50</sub> of the compound, four parameters equation is employed for curve fitting. The errors in reproducing the dissociation constants are typically less than two-fold.

In particular, the compounds of the following examples had activity in inhibiting the  
 15 beta-secretase enzyme in the aforementioned assay, generally with an IC<sub>50</sub> from about 1 nM to 1 µM. Such a result is indicative of the intrinsic activity of the compounds in use as inhibitors of beta-secretase enzyme activity.

Several methods for preparing the compounds of this invention are illustrated in the following Schemes and Examples. Starting materials are made according to procedures known  
 20 in the art or as illustrated herein. The following examples are provided so that the invention might be more fully understood. These examples are illustrative only and should not be construed as limiting the invention in any way.

After 1 hr the reaction was quenched with H<sub>2</sub>O (100 mL) and extracted with EtOAc (3x 50 mL). The organic extracts were dried over MgSO<sub>4</sub> and evaporated to give the product.  $^1\text{H}$  NMR (DMSO  $d_6$ )  $\delta$  8.40 (s, 1H), 8.19 (s, 2H), 3.91 (s, 6H), 3.34 (s, 3H), 3.01 (s, 3H).
